

French Psychotherapy Practice Research Network

Objectives : Studying outcomes and mechanisms of change in naturalistic therapies for three major clinical problems : ● Self-damaging or mutilating acting processes at adolescents and adults with borderline personality disorder ● Development and emergences in the psychotherapy process of children with autistic syndrome ● Behavioral problems of Alzheimer patients.

Method : Prospective, longitudinal, observational study of more than 300 cases of patients from 150-300 clinicians working in peer's groups. Case formulation by clinicians and standardized assessments from verbatim and audio data. Comprehensive analysis of process with *Psychotherapy Process Q-sort* (Jones) and of functioning with *HSRS* (Luborsky) and *Psychodynamic Functioning Scales* (Hoglund). Analysis of data using differences between analogous cases, statistical mediation approach and chronological changes.

Systematic case studies are related to a descriptive epidemiological study
